

How to Implement Custom Field Help Text in Oracle Redwood using VBS

Date: Aug 10, 2026

Section 1: Objective/Overview

The purpose of this guide is to provide technical instructions for adding custom warning or help text above fields on an Oracle Redwood page. By leveraging Visual Builder Studio (VBS) and JavaScript, developers can enhance the user interface with mandatory field reminders or helpful guidance without modifying core application logic.

Section 2: Implementation Steps

Step 1: Open VBS & Switch to Advanced Mode

1. **Open** your target page in Oracle Cloud.
2. **Click** your Profile Icon and select 'Edit Page in Visual Builder Studio'.
3. **Switch** the toggle at the top from 'Express' to 'Advanced' mode.

Step 2: Paste the JavaScript Code

1. **Navigate** to the 'JavaScript' tab on the left menu.
2. **Paste** the following code into the editor:

```
JavaScript
define(['jquery'], ($) => {
  'use strict';

  class PageModule {}

  PageModule.prototype.myFunction = function () {
    setInterval(function () {
      let target = $(".oj-filepicker-dropzone");
```

```

        if (target.length > 0 && $("#attach-helper-msg").length === 0) {
            target.before(
                '<span id="attach-helper-msg" style="color:red;
font-weight:bold; display:block; margin-bottom:8px;">' +
                '⚠ Attachment is mandatory. Please add at least one
appropriate document.' +
                '</span>'
            );
        }
    }, 500);
};

return PageModule;
});

```

Step 3: Create the Action Chain

1. **Open** the 'Action Chains' tab.
2. **Create** a new chain by clicking '+ Action Chain'.
3. **Add** a 'Call Function' action to the canvas.
4. **Select** 'myFunction' in the right-hand properties panel.

Step 4: Attach the Event Listener

1. **Go** to the 'Event Listeners' tab.
2. **Create** a new listener using '+ Event Listener'.
3. **Identify** the trigger event (e.g., 'vbEnter').
4. **Connect** it to your Action Chain.

Section 3: Customization & Targeting

Follow these steps if you need to add helper text above a specific field, such as Job Title or Department, instead of the default Attachment box:

- **Inspect** the field by right-clicking it on the page.
- **Identify** the specific Class (e.g., .my-field-class) or ID (e.g., #myFieldId).

Update the JavaScript code by replacing ".oj-filepicker-dropzone" with your identified Class or ID.
